Atty Docket No.: 107317-00026

AMENDMENTS TO THE CLAIMS

Listing of the claims:

Following is a listing of all claims in the present application, which listing supersedes all previously presented claims:

1. (Currently Amended) A MOS-type solid-state image pickup device,

comprising:

a semiconductor substrate;

a large number of pixels arranged in one surface of said semiconductor substrate in an array having a plurality of rows and a plurality of columns, each said pixel includes (a) a photoelectric converter element and (b) a switching circuit electrically connected to said photoelectric converter element for controlling generation of an output signal representing electric charge accumulated in said photoelectric converter element and discharge of the electric charge;

a row selection signal line disposed for each pixel row and being electrically connected to associated switching circuits, each said row selection signal line receiving a row selection signal for controlling the generation of the output signal;

a plurality of output signal lines each of which being associated with at least one pixel column and receiving the output signal from associated switching circuits;

a reset signal line disposed for each said pixel row and being electrically connected to associated switching circuits, each said reset signal line receiving a reset signal for controlling the discharge of the electric charge; and

3

Atty Docket No.: 107317-00026

an overall reset controller <u>positioned within a column-directional shifter</u> for supplying the reset signal to said reset signal lines at <u>one</u> a time.

2. (Original) A MOS-type solid-state image pickup device according to claim 1, wherein each said switching circuit comprises:

an output transistor including a control terminal electrically connected to said photoelectric converter element for generating the output signal;

a row selection transistor electrically connected in series to said output transistor, said row selection transistor including a control terminal electrically connected to said row selection signal line; and

a reset transistor electrically connected to said photoelectric converter element, said reset transistor including a control terminal electrically connected to said reset signal line.

- 3. (Original) A MOS-type solid-state image pickup device according to claim 2, further comprising a plurality of constant-voltage supply lines extending in a direction of said pixel column or row for receiving a constant voltage, each said pixel column or row being associated with one of said constant-voltage supply lines, each said constant-voltage supply line being electrically connected to said output transistors and said reset transistors in said associated pixel column or row.
- 4. (Original) A MOS-type solid-state image pickup device according to claim 1, further comprising:

a readout row-shifter for sequentially supplying the row selection signal to said row selection signal lines;

a reset row-shifter for sequentially supplying the reset signal to said reset signal lines; and

an image signal outputting device electrically connected to said output signal lines for generating an image signal representing the output signal and for sequentially outputting the image signal.

5. (Currently Amended) A MOS-type solid-state image pickup device according to claim 4, wherein said image signal outputting device comprising comprises:

an analog signal generator for converting the output signal generated on each said output signal line into an analog voltage signal; and

a row-directional shifter for controlling operation of said analog signal generator and for being sequentially outputted the analog voltage signal from said analog signal generator.

6. (Currently Amended) A MOS-type solid-state image pickup device according to claim 4, wherein said image signal outputting device comprising comprises:

an analog signal generator for converting the output signal generated on each said output signal line into an analog voltage signal; and

an analog-to-digital converter for receiving the analog voltage signal and for converting the analog voltage signal into a digital signal; and

a buffer memory for receiving the digital signal, temporarily keeping the digital signal therein, and outputting the digital signal therefrom.

- 7. (Original) A MOS-type solid-state image pickup device according to claim 4, further comprising a controller for controlling operations of said overall reset controller, said readout row-shifter, said reset row-shifter, and said image signal outputting device.
- 8. (Original) A MOS-type solid-state image pickup device according to claim 2, further comprising:

a transfer signal line disposed for each said pixel row and being electrically connected to associated switching circuits; and

a transfer control row-shifter for sequentially supplying a transfer control signal controlling the generation or the discharge of the output signal to said transfer signal lines, and each said switching circuit further comprises a charge transfer transistor electrically connected to said photoelectric converter element, said output transistor, and said reset transistor, said charge transfer transistor including a control terminal electrically connected to said transfer signal line.

9. (Original) A MOS-type solid-state image pickup device according to claim 8, further comprising a plurality of constant-voltage supply lines extending in a direction

Atty Docket No.: 107317-00026

of said pixel column or row for receiving a constant voltage, each said pixel column or row being associated with one of said constant-voltage supply lines, each said constant-voltage supply line being electrically connected to said output transistors; said reset transistors and said charge transfer transistor in said associated pixel column or row.

10. (Original) A MOS-type solid-state image pickup device according to claim 8, further comprising:

a readout row-shifter for sequentially supplying the row selection signal to said row selection signal lines;

a reset row-shifter for sequentially supplying the reset signal to said reset signal lines;

a transfer control row-shifter for sequentially supplying the transfer control signal to said transfer signal lines; and

an image signal outputting device electrically connected to said output signal lines for generating an image signal representing the output signal and for sequentially outputting the image signal.

11. (Currently Amended) AMOS-type solid-state image pickup device according to claim 10, wherein said image signal outputting device comprising comprises:

an analog signal generator for converting the output signal generated on each said output signal line into an analog voltage signal; and

Atty Docket No.: 107317-00026

a row-directional shifter for controlling operation of said analog signal generator and for being sequentially outputted the analog voltage signal from said analog signal generator.

12. (Currently Amended) A MOS-type solid-state image pickup device according to claim 10, wherein said image signal outputting device comprising comprises:

an analog signal generator for converting the output signal generated on each said output signal line into an analog voltage signal; and

an analog-to-digital converter for receiving the analog voltage signal and for converting the analog voltage signal into a digital signal; and

a buffer memory for receiving the digital signal, temporarily keeping the digital signal therein, and outputting the digital signal therefrom.

- 13. (Original) A MOS-type solid-state image pickup device according to claim 10, further comprising a controller for controlling operations of said overall reset controller, said readout row-shifter, said reset row-shifter, said transfer control row-shifter, and said image signal outputting device.
 - 14. (Currently Amended) A digital camera, comprising:
 - a MOS-type solid-state image pickup device, comprising:
 - (i) a semiconductor substrate;

(ii) a large number of pixels arranged in one surface of said semiconductor substrate in an array having a plurality of rows and a plurality of columns, each said pixel includes (a) a photoelectric converter element and (b) a switching circuit electrically connected to said photoelectric converter element for controlling generation of an output signal representing electric charge accumulated in said photoelectric converter element and discharge of the electric charge;

- (iii) a row selection signal line disposed for each pixel row and being electrically connected to associated switching circuits, each said row selection signal line receiving a row selection signal for controlling the generation of the output signal;
- (iv) a plurality of output signal lines each of which being associated with at least one pixel column and receiving the output signal from associated switching circuits;
- (v) a reset signal line disposed for each said pixel row and being electrically connected to associated switching circuits, each said reset signal line receiving a reset signal for controlling the discharge of the electric charge;
- (vi) a readout row-shifter for sequentially supplying the row selection signal to said row selection signal lines;
- (vii) a reset row-shifter for sequentially supplying the reset signal to said reset signal lines;
- (viii) an overall reset controller <u>positioned within a column-directional</u>

 <u>shifter</u> for supplying the reset signal to said reset signal lines at one a time; and

(ix) an image signal outputting device electrically connected to said output signal lines for generating an image signal representing the output signal and for sequentially outputting the image signal;

an image signal processor for generating mobile picture data or still picture data using the image signal outputted from said MOS-type solid-state image pickup device;

a light shielding device for interrupting light incident to said MOS-type solid-state image pickup device;

a still picture indication signal generator for generating a still picture indication signal indicating shooting of a still picture;

a mobile picture mode controller electrically connected to said MOS-type solidstate image pickup device for continually control operation thereof for repeatedly
conducting (a) an image readout operation in which the row selection signal issequentially supplied from said readout row-shifter to a predetermined number of row
selection signal lines for sequentially outputting from said image signal outputting device
an image signal representing the output signal generated on each said output signal line
and (b) an electronic shutter operation in which the reset signal is sequentially supplied
from said reset row-shifter to said reset signal supply lines at least associated with said
pixel row as an object of the image signal readout operation for sequentially discharge
electric charge accumulated in said photoelectric converter elements; and

a first still picture mode controller electrically connected to said MOS-type solidstate image pickup device for controlling in place of said mobile mode controller, when the still picture indication signal is outputted, operations of said MOS-type solid-state image pickup device and said light shielding device, for conducting an overall reset

Atty Docket No.: 107317-00026

operation in which the overall reset controller is operated, in a state in which the operations of said readout row-shifter and said rest row-shifter are stopped, and electric charge accumulated in all said photoelectric converter elements is discharged, and for conducting an image signal readout operation in which said light shielding device is operated and interrupts the incident light for a predetermined period of time after the overall reset operation is finished, and the row selection signal is sequentially supplied from said readout row-shifter to said row selection signal lines for sequentially outputting an image signal representing the output signal generated on said output signal lines from said image signal outputting device.

15. (Currently Amended) A digital camera according to claim 14, wherein: when an electronic shutter operation or an image signal readout operation is being executed at a point of time when the still picture indication signal is outputted, said first still picture mode controller does not interrupt the operation; and

when an electronic shutter operation is being executed at a point of time when the still picture indication signal is outputted, said first still picture mode controller conducts once the image signal readout operation once after the electronic shutter operation; and then the first still picture mode controller conducts the overall reset operation.

16. (Currently Amended) A digital camera according to claim 14, wherein said MOS-type solid-state image pickup device[[,]] further comprising comprises:

Atty Docket No.: 107317-00026

a transfer signal line disposed for each said pixel row and being electrically connected to associated switching circuits; and

a transfer control row-shifter for sequentially supplying a transfer control signal controlling the generation or the discharge of the output signal to said transfer signal lines, and

each said switching circuit further comprises

a charge transfer transistor electrically connected to said photoelectric converter element, said output transistor, and said reset transistor,

said charge transfer transistor including a control terminal electrically connected to said transfer signal line,

said mobile picture mode controller or said first still picture mode controller conducting said transfer control row-shifter for sequentially supplying, in the image readout operation, the row reset operation, or the overall reset operation, the transfer control signal to each said transfer signal lines associated with said pixel row as an object of the operation.

17. (Currently Amended) A digital camera according to claim 14, further comprising:

a strobe device for emitting flash light when a predetermined signal is received or said strobe device installing device for installing therein;

a second still picture mode controller electrically connected to said MOS-type solid-state image pickup device for controlling in place of said mobile mode controller, when the still picture indication signal is outputted, operations of said MOS-type solid-

state image pickup device and said light shielding device, for conducting an overall reset operation in which the overall reset controller is operated, in a state in which the operations of said readout row-shifter and said rest row-shifter are stopped, and electric charge accumulated in all said photoelectric converter elements is discharged, and for conducting an image signal readout operation in which after the overall reset operation is finished, a strobe device operation signal is generated for operating said strobe device; said light shielding device is operated and interrupts the incident light for a predetermined period of time after <u>said</u> strobe device operation signal is generated; and the row selection signal is sequentially supplied from said readout row-shifter to said row selection signal lines for sequentially outputting an image signal representing the output signal generated on said output signal lines from said image signal outputting device; and

a still picture mode specifying device for beforehand specifying; beforehand, a still picture mode controller to be operated operate when the still picture indication signal is outputted.

18. (Currently Amended) A digital camera according to claim 17, wherein: when an electronic shutter operation or an image signal readout operation is being executed at a point of time when the still picture indication signal is outputted, said second still picture mode controller does not interrupt the operation; and

when an electronic shutter operation is being executed at a point of time when the still picture indication signal is outputted, said second still picture mode controller conducts once the image signal readout operation once after the electronic shutter

Atty Docket No.: 107317-00026

operation; and then the second still picture mode controller conducts the overall reset operation.

19. (Currently Amended) A digital camera according to claim 17, wherein said MOS-type solid-state image pickup device[[,]] further comprising comprises:

a transfer signal line disposed for each said pixel row and being electrically connected to associated switching circuits; and

a transfer control row-shifter for sequentially supplying a transfer control signal controlling the generation or the discharge of the output signal to said transfer signal lines, and

each said switching circuit further comprises

a charge transfer transistor electrically connected to said photoelectric converter element, said output transistor, and said reset transistor.

said charge transfer transistor including a control terminal electrically connected to said transfer signal line.

said mobile picture mode controller, said first still picture mode controller or said second still picture mode controller conducting said transfer control row-shifter for sequentially supplying, in the image readout operation, the row reset operation, or the overall reset operation, the transfer control signal to each said transfer signal lines associated with said pixel row as an object of the operation.
